With its C-Base, Bühler is offering you the possibility of exchanging your floors within a short time and at low cost.

The main processes in the malting industry demand particular attention. Not only do they have an impact on your product quality, but also on the productivity of your plant.

The production of homogeneous malt requires uniform aeration. The C-Base offers a regular gap geometry with a narrow edge. The clear area of 28% through which the air can flow optimizes aeration.

Unlike riveted floors with perforated screens, the C-Base is in addition less expensive and can be installed within a shorter time, thus minimizing the downtime of your production plant.

The Bühler C-Base is a simple, standardized component which is available in stainless steel or galvanized steel.
